International Classification of Headache Disorders, 3rd Edition

How to use the classification
Classification
Part one: the primary headaches
1. Migraine
2. Tension-type headache (TTH)
3. Trigeminal autonomic cephalalgias (TACs)
4. Other primary headache disorders
Part two: the secondary headaches
5. Headache attributed to trauma or injury to the head and/or neck
6. Headache attributed to cranial or cervical vascular disorder
7. Headache attributed to non-vascular intracranial disorder
8. Headache attributed to a substance or its withdrawal
9. Headache attributed to infection
10. Headache attributed to disorder of homeostasis
11. Headache or facial pain attributed to disorder of the ear, nose, throat, eye, ear, nose, sinusitis, teeth, mouth or other facial or cervical structure
12. Headache attributed to psychiatric disorder
Part three: painful cranial neuropathies, other facial pains and other headaches
13. Painful lesions of the cranial nerves and other facial pain
14. Other headache disorders
Appendix

Home

The International Classification of Headache Disorders 3rd edition

On behalf of the Classification Committee of The International Headache Society I am proud to present the third edition of the International Classification of Headache Disorders (ICHD-3). This follows the publication of ICHD-2 beta in 2013. The idea behind the beta version was to provide more field testing before presentation of the final ICHD-3, and this has worked well. There have been excellent field-testing studies published, in migraine with aura, cluster headache, idiopathic intracranial hypertension and trigeminal autonomic cephalalgias among others. It was, for example, documented that the Appendix criteria for A1.2 Migraine with aura were superior to the criteria for 1.2 Migraine with aura in the main body of ICHD-3 beta, better discriminating this disorder from transient ischaemic attacks. Field testing of the novel associated features in criterion C1 for 3.1 Cluster headache, facial flushing and aura fullness, revealed that they did not add to diagnostic discrimination. Consequently, these symptoms are included only in the Appendix of ICHD-3, where they invite further study. These are examples of the evidence-based process of disease classification that low underpins all future changes to the International Classification of Headache Disorders.

A contributing reason for the beta version was, as we thought, so that ICHD-3 could when published include the codes of the International Classification of Diseases, 11th edition (ICD-11), from the World Health Organization (WHO). We expected that ICD-11 would be finished in 2016, but unfortunately there have been long and unexpected delays so that the final codes are still not available. We therefore have to publish ICHD-3 without them.

ICHD-3 is published as the first issue of Cephalalgia in 2018, exactly 30 years after the first edition of the International Classification of Headache Disorders, ICHD-1 as we now call it. This first version was based primarily upon the opinions of experts, but proved nevertheless to be largely valid. ICHD-1 published in 2004 included a number of changes prompted partly by new evidence and partly by revised opinions of experts. New scientific evidence played a relatively greater role in the changes made in ICHD-3 beta, and all the further changes included in ICHD-3 are based on such evidence. Thus headache classification is now and will in the future be driven entirely by research.

A long journey that started in 2010 has ended with the publication of ICHD-3, but the present committee has still much to do for a couple of years. ICHD-3 beta was translated into many languages, and these translations need updating before ICHD-3 can be published in those languages. Hopefully many additional translations will be published so that ICHD-3 becomes available in all major and even in many minor languages. An electronic version of ICHD-3 beta already developed under the leadership of Professor Harmut Gobel has been updated to ICHD-3. A case book is planned in a collaboration between Professors Morris Levin and Jes Olesen. Finally, a cross-walk between ICHD-3 and WHO's ICD-11 will be made by Professors Timothy Steiner and Jes Olesen as soon as the codes for ICD-11 become available.

What then is the future of headache classification? Classification must in principle be a conservative discipline. When major changes are made to a classification, all previous studies using those parts of the classification that are changed must be revisited. Drug trials according to previous diagnostic criteria must, for example, be repeated if diagnostic criteria undergo major changes, because patients falling under the new diagnosis will be different from those falling under the previous diagnosis. My hope is that the active field testing and scientific analysis that have been done for ICHD-3 will continue, allowing future changes to be entirely evidence-based. Following the tradition, it will be 10-15 years before ICHD-4, but a number of field testing studies will be produced in the meantime. Modified ICHD-3 diagnostic criteria for 1.3 Chronic migraine were published in Cephalalgia. The Classification Committee endorsed these changes, asking for their immediate use even though they were not integrated into the International Classification of Headache Disorders until ICHD-3 beta appeared years later. A future headache classification committee should similarly be able to endorse and support the adoption of new or revised diagnostic criteria before publishing ICHD-4 when they are substantiated by good field-testing studies published in Cephalalgia.

ICHD-1 took headache classification from being one of the worst-classified neurological diseases to being the best. We have kept this momentum for 30 years, and the superiority of our classification became evident recently during the committee work in Geneva on the neurological section of ICD-11. No other discipline within neurology has such a systematic classification with explicit diagnostic criteria for every disease entity. I sincerely hope that this tradition can be upheld in the future, and that headache can continue to lead the way in the classification of neurological diseases.

Jes Olesen
Chairman

Headache Impact Test

Interpretatie: De score kan variëren van 36 tot 78 punten. Hoe hoger de score, hoe groter de impact op het leven.

Score 66 of meer:
Uw hoofdpijn heeft een zeer zware invloed op uw dagelijks leven. Het is mogelijk dat u invaliderende pijn en andere symptomen ervaart die veel ernstiger zijn dan voor andere hoofdpijnpatronen. Laat uw hoofdpijn u niet weerhouden om van de belangrijke dingen in het leven te genieten, zoals uw familie, werk, school of activiteiten in uw vrije tijd.

Score 56-65:
Uw hoofdpijn heeft een aanzienlijke invloed op uw dagelijks leven. Het is mogelijk dat u invaliderende pijn en andere symptomen ervaart, waardoor u soms minder tijd kunt besteden aan uw familie, werk, school of activiteiten in uw vrije tijd.

Score 50-55:
Uw hoofdpijn lijkt invloed te hebben op uw dagelijks leven. Uw hoofdpijn zou u niet moeten hinderen om tijd te besteden aan uw familie, werk, school of activiteiten in uw vrije tijd.

Score 49 of minder:
Uw hoofdpijn heeft momenteel weinig of geen invloed op uw dagelijkse leven. Wij raden u aan om de HIT-6 elke maand in te vullen om de invloed van hoofdpijn op uw dagelijks leven te blijven volgen.

Hoofdpijn Impact Test (HIT-6)

QualityMetric, Inc. and GlaxoSmithKline Group of Companies.

Instructies: Deze vragenlijst is ontwikkeld om u te helpen beschrijven en uit te drukken hoe u zich voelt en wat u vanwege hoofdpijn niet kunt doen.

Om de vragenlijst in te vullen graag één antwoord per vraag aankruisen.

	Nooit	Zelden	Soms	Vaak	Altijd
	0	0	0	0	0
1. Wanneer u hoofdpijn heeft, hoe vaak is de pijn dan hevig?					
2. Hoe vaak wordt u door hoofdpijn beperkt in uw vermogen om gebruikelijke dagelijkse activiteiten te doen, zoals het huishouden, werk, studie/opleiding of sociale activiteiten?					
3. Wanneer u hoofdpijn heeft, hoe vaak wenst u dan dat u zou kunnen gaan liggen?					
4. Hoe vaak in de afgelopen 4 weken heeft u zich te moe gevoeld om uw werk of dagelijkse activiteiten te doen vanwege hoofdpijn?					
5. Hoe vaak in de afgelopen 4 weken was u het beu of voelde u zich geïrriteerd vanwege hoofdpijn?					
6. Hoe vaak in de afgelopen 4 weken werd u door hoofdpijn beperkt in uw vermogen om u te concentreren op uw werk of dagelijkse activiteiten?

Bruce et al., *Current Neurology and Neuroscience Reports* 2008

14

Treatment plans for patients with medication-overuse headache should include the following:

- Patient education. Patients need to understand that
 - acute medication overuse can increase headache frequency
 - when medication overuse is stopped, headache might worsen temporarily and other withdrawal symptoms might occur
 - many patients will experience a long-term reduction in headache frequency after medication overuse is stopped
 - prophylactic medications might become more effective
- A strategy for cessation of medication overuse
 - abrupt withdrawal should be advised for patients with suspected medication-overuse headache caused by simple analgesics (acetaminophen, NSAIDs) or triptans; however, gradual withdrawal is also an option
 - gradual withdrawal should be advised for patients with suspected medication-overuse headache caused by opioids and opioid-containing analgesics
- Provision of a prophylactic medication while medication overuse is stopped. While many prophylactic agents are used (tricyclics, β -blockers, etc), drugs with the best evidence for efficacy in chronic migraine with medication overuse are
 - onabotulinumtoxinA, 155 units to 195 units injected at intervals of 3 mo by clinicians experienced in its use for headache
 - topiramate with slow titration to a target dose of 100 mg/d
- A strategy for the treatment of remaining severe headache attacks with limitations on frequency of use (eg, a triptan for patients with analgesic overuse, dihydroergotamine for patients with triptan overuse, etc)
- Patient follow-up and support

Cervicogenic Headache - CEH

Due to cervical dysfunction
Is debated in neurology

Prevalence 4,1%
 0.17%

Overdiagnosed

Sjaastad, *Act. Neurol. Scand*, 2008
Knacksted, *Cephalalgia*, 2010
Steiner, *J Head Pain*, 2019

21

CEH - Criteria

Major criteria

- Neck involvement
 - Mechanical provocation (movements, position, pressure)
 - CROM ↓
 - Ipsilateral shoulder/ arm pain
- Confirmation by anaesthetic block
- Unilateral, without side-shift

Head pain characteristics

- Moderately intense, not pulsating, not lancinating
- Rather continuous, like neck pain
- Occipital start

Other

- Mostly female patients
- History with neck trauma
- Associated symptoms: rare
- Marginal effect of specific medication (Indomethacin, ergots, triptans)

Sjaastad, 1983 -> 2008 (CHISG criteria)

22

11.2.1 Cervicogenic headache

Coded elsewhere:

Headache causally associated with cervical myofascial pain sources (myofascial trigger points) may, when it meets other criteria, be coded as 2.1.1 *Infrequent episodic tension-type headache associated with pericranial tenderness*, 2.2.1 *Frequent episodic tension-type headache associated with pericranial tenderness* or 2.3.1 *Chronic tension-type headache associated with pericranial tenderness*. A11.2.5 *Headache attributed to cervical myofascial pain* is an Appendix diagnosis awaiting evidence that this type of headache is more closely related to other cervicogenic headaches than to 2. *Tension-type headache*. Clearly, there are many cases which overlap these two categories, for which diagnosis can be challenging.

Description:

Headache caused by a disorder of the cervical spine and its component bony, disc and/or soft tissue elements, usually but not invariably accompanied by neck pain.

Diagnostic criteria:

- A. Any headache fulfilling criterion C
- B. Clinical and/or imaging evidence¹ of a disorder or lesion within the cervical spine or soft tissues of the neck, known to be able to cause headache²
- C. Evidence of causation demonstrated by at least two of the following:
 - 1. headache has developed in temporal relation to the onset of the cervical disorder or appearance of the lesion
 - 2. headache has significantly improved or resolved in parallel with improvement in or resolution of the cervical disorder or lesion
 - 3. cervical range of motion is reduced and headache is made significantly worse by provocative manoeuvres
 - 4. headache is abolished following diagnostic blockade of a cervical structure or its nerve supply
- D. Not better accounted for by another ICHD-3 diagnosis^{3,4,5}.

Notes:

- 1. Imaging findings in the upper cervical spine are common in patients without headache; they are suggestive but not firm evidence of causation.
- 2. Tumours, fractures, infections and rheumatoid arthritis of the upper cervical spine have not been formally validated as causes of headache, but are accepted to fulfil criterion B in individual cases. Cervical spondylosis and osteochondritis may or may not be valid causes fulfilling criterion B, again depending on the individual case.
- 3. When cervical myofascial pain is the cause, the headache should probably be coded under 2. *Tension-type headache*; however, awaiting further evidence, an alternative diagnosis of A11.2.5 *Headache attributed to cervical myofascial pain* is in the Appendix.
- 4. Headache caused by upper cervical radiculopathy has been postulated and, considering the now well-understood convergence between upper cervical and trigeminal nociception, this is a logical cause of headache. Pending further evidence, this diagnosis is in the Appendix as A11.2.4 *Headache attributed to upper cervical radiculopathy*.
- 5. Features that tend to distinguish 11.2.1 *Cervicogenic headache* from 1. *Migraine* and 2. *Tension-type headache* include side-locked pain, provocation of typical headache by digital pressure on neck muscles and by head movement, and posterior-to-anterior radiation of pain. However, while these may be features of 11.2.1 *Cervicogenic headache*, they are not unique to it and they do not necessarily define causal relationships. Migrainous features such as nausea, vomiting and photo/phonophobia may be present with 11.2.1 *Cervicogenic headache*, although to a generally lesser degree than in 1. *Migraine*, and may differentiate some cases from 2. *Tension-type headache*.

Change score (95% CI) preintervention to 12 mo postintervention	28 (22, 35)	6 (1, 12)

Abbreviations: CI, confidence interval; SD, standard deviation; SEM, standard error of mean.
* Headache severity index (range, 0-100; larger scores indicate greater severity).

CEH – Treatment

Treatment options - Guideline

- Education
- Postural advice
- Deep Neck flexor training
- Mobilisations and manipulations of thoracic and (upper)cervical spine

A. Consider the following therapeutic options based upon shared decision making between patient and provider:^{b,c}

Home and clinic-based interventions:

- 1) Low-load endurance craniocervical and cervicospinal exercises; or
- 2) Manual therapy (manipulation with or without mobilization) to the cervical and thoracic spine

B. Do not offer:^d

- 1) Multimodal program of care that combines spinal manipulation, spinal mobilization, and low load endurance exercises

TTH - Treatment

Treatment options - Guideline

- Education
- General exercise
- Postural advice
- Deep Neck flexor training
- Mobilisations of thoracic and (upper)cervical spine
- Clinical massage

A. Consider the following therapeutic options based upon shared decision making between patient and provider:^{b,c}

Home and clinic-based interventions:

- 1) General exercise (warm-up, neck and shoulder stretching and strengthening, aerobic exercises)
- 2) Low load endurance craniocervical and cervicospinal exercises;
- 3) Multimodal care that includes spinal mobilization, craniocervical exercises, and postural correction; or
- 4) Clinical massage on shoulders, upper back, connecting area of neck and shoulders, shoulder tips, the back of head, the middle line of head, face

B. Do not offer:^d

- 1) Manipulation of the cervical spine

Coté, Eur J Pain, 2019

- Treatment

(attributed to TMD)

Migraine – common migraine

- Minimum 5 aanvallen
- Duur: 4-72 uur
- Minstens 2 van de volgende:
- Unilateraal
 - Pulserend
 - Matig tot ernstig (invaliderend)
 - Toename door fysieke inspanning of kinesifobie-inducerend
- Tijdens hoofdpijn minstens één van de volgende:
- Nausea en/of braken
 - Foto- én fonofobie
- Geen andere aandoening

MIGRAINE – With AURA

- A. At least two attacks fulfilling criteria B and C
- B. One or more of the following fully reversible aura symptoms:
 - 1. visual
 - 2. sensory
 - 3. speech and/or language
 - 4. motor
 - 5. brainstem
 - 6. retinal
- C. At least two of the following four characteristics:
 - 1. at least one aura symptom spreads gradually over ≥ 5 minutes, and/or two or more symptoms occur in succession
 - 2. each individual aura symptom lasts 5-60 minutes¹
 - 3. at least one aura symptom is unilateral²
 - 4. the aura is accompanied, or followed within 60 minutes, by headache
- D. Not better accounted for by another ICHD-3 diagnosis, and transient ischaemic attack has been excluded.

SHORT REPORT

Open Access

Stratifying migraine patients based on dynamic pain provocation over the upper cervical spine

Kerstin Luedtke and Arne May*

Fig. 8 Palpation of the upper cervical spine. 1 = midline C1, 2 = spinous process C2, 3 = anterolateral joint, 4 = anteromedial joint

Findings: Using simple palpation of the upper cervical spine, migraine patients can be stratified into three groups: painfree (11%), local pain only (42%), and pain referred to the head during sustained pressure (47%). Combining both test components (palpation and sustained pressure) has a high sensitivity and specificity for migraine.

Conclusions: The response to palpation of the upper cervical spine may indicate migraine subtypes. The presence of musculoskeletal dysfunctions of the upper cervical spine should be identified and treated to avoid ongoing nociceptive input into the trigeminocervical complex.
